Skills

Languages: JavaScript, TypeScript, SQL

Technologies & Tools: NodeJS, ExpressJS, NestJS, ReactJS, PostgreSQL, MySQL, Redis, Firebase, Socket.IO, Nginx, PM2, Websockets, Html, CSS, AWS, EC2, MongoDB, S3, SQS, Lambda, CloudWatch, Grafana, Claude, Cursor, Docker

Work Experience

Tech Alchemy, Pune

June 2023 – Present

Software Development Engineer

- Optimized API latency from 60s to 2s by decoupling synchronous request flow from heavy write operations (thousands of transaction entries) using NodeJS Worker threads module. Employed asynchronous task delegation with AWS SQS to ensure reliable background processing and eliminate data loss during high-throughput scenarios.
- Implemented cross-region database replication to optimize read performance and reduce latency across geographies, significantly offloading traffic from the primary database and improving system scalability under high read loads.
- Implemented caching strategies (Redis) and optimized database indexing to accelerate query performance on user data at scale, reducing response times and ensuring efficient access across millions of records.
- Replaced full in-memory file loading with NodeJS streams to process large CSV files in chunks, preventing CPU spikes and memory bottlenecks, and ensuring stable performance during heavy data ingestion tasks.
- Drove production-grade performance and reliability through hands-on ownership—optimizing REST APIs, resolving data consistency issues in horizontally scaled services, and successfully load testing to sustain 1M+ concurrent users and 10k+ daily actives.
- **Skills: NodeJS, TypeScript, AWS (SQS, EC2), PostgreSQL, Redis, NestJS, Streams, MongoDB, ReactJS**

Education

GNIT Kolkata

April 2019 - May 2023

B.Tech. in Computer Science and Engineering

CGPA: 8.45/10

Relevant Coursework: Object Oriented Programming, Databases, Data Structures and Algorithms, System Design

Project Work

Web3Toolkit: [Link](#)

- Solved inconsistent real-time notifications in a horizontally scaled environment by implementing a Redis Pub/Sub architecture. Events captured from MongoDB via AWS SQS were published to a centralized Redis channel, enabling all application instances to receive and broadcast notifications consistently, effectively replicating a fan-out messaging pattern across the cluster.
- Utilized WebSocket-based event listening and multi-call mechanisms to interact with blockchain contracts in a robust backend built on a monorepo microservices architecture, leveraging NestJS, ExpressJS, PostgreSQL, Redis (caching), and SQS for message queueing, with contract integration via Ethers.js and Web3.js.
- Architected a fault-tolerant event ingestion pipeline by decoupling blockchain event listeners from downstream processing services using AWS SQS. The solution guaranteed event durability during service downtime, enabled seamless replay and backfilling on recovery, eliminated data loss risks, reduced RPC reprocessing overhead, and improved overall system reliability while contributing to infrastructure cost optimization.
- Built client-facing CRM dashboards to visualize real-time on-chain transaction activity, project revenues, and country-wise participation metrics, delivering actionable business intelligence and operational insights across global user bases.
- **Skills: NestJS, PostgreSQL, SQS, Redis, Socket.IO, Web3.js, MongoDB, JWT.**

AreYouIn:

- Re-architected and developed the backend infrastructure for a multifaceted mobile and web application. Integrated user registration, login, event creation, friend invitations, event recommendations, and personalized rankings.
- **Skills: NodeJS, MongoDB, PM2, Redis, JWT.**
